

Respondus Monitor

Recently Added Features

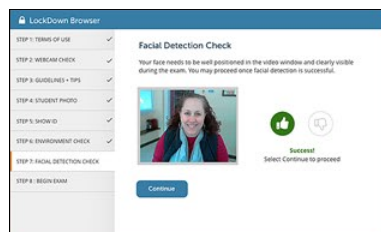

Respondus pioneered automated proctoring over six years ago. But with new features being added almost monthly, it always feels shiny and new. Highlighted below are some of the top features from recent releases.

New in Q1 2019

» Facial detection check before exam

Respondus Monitor performs a facial detection check before the start of an exam. This helps students identify problems with badly positioned webcams, poor lighting, and prevents the intentional covering of a webcam.

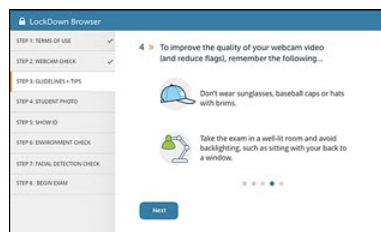

» Facial detection alerts during exam

The system alerts students during the exam when facial detection is lost for a certain length of time. A quick adjustment is usually all it takes.

» Pre-exam tips

A new step in the startup sequence helps students avoid things that trigger false “flags” within the system.

Highlights from Q3 & Q4 2018

» Review Priority

A new scoring system gives instructors an easy way to identify exam sessions that require deeper scrutiny. It analyzes both the quality of the video data and the events that indicate an exam violation may have occurred.

» Timeline

The timeline is part of a broader UX update that shows events (flags, milestones) from an exam session in a clear, meaningful way. The instructor can then view the video from a selected point on the timeline.

» Exam Stats

Class-wide summaries of exam data are now included in the instructor dashboard, such as average time spent on each question, average duration for the exam, and more.

» Welcome resources

A new resource area for instructors appears in the LockDown Browser dashboard itself, making it easy for instructors to get started with Respondus Monitor.
